ABSTRACT OF THE DISCLOSURE

2 A method of fast fingerprint search space partitioning and prescreening is disclosed. The
3 method comprises the steps of: inputting the contents of a fingerprint repository comprising file
4 fingerprints for index creation; creating an index based on each minutia and selected neighbors
5 of each minutia in each file fingerprint in the repository; searching the index to identify all
6 minutiae which correspond to the minutiae in a search fingerprint; and analyzing results of this
7 search to determine which file fingerprints contributed the most minutiae with the best
8 correspondence to the minutiae in the search fingerprint.
